Dutch ‘but’ as a sequential conjunction

Its use as a resumption marker

Harrie Mazeland and Mike Huiskes*
University of Groningen/University of Utrecht

In Dutch, the connective maar (‘but’) is recurrently used as a sequential conjunction linking turns. In the type of use we will focus on, it alludes to a contrast at the level of discourse organization. The speaker resumes a line of development that was abandoned in favor of a competing line of talk, and proposes that the abandoned line becomes the focus of talk again.

Speakers can return in different ways to an abandoned line of talk. Continuations present the return as an unproblematic next step, whereas resumptions deal with the return as a task that is not an unproblematic thing to do (Section 2). We discuss two prototypical environments in which resumptions occur: after repair-sequence expansion, and after a competing line of topic development. They have in common that the preceding line of talk is oriented to as an alternative to the line that is resumed (Section 3). The turn-constructional format is examined in Section 4. Apart from the level of linguistic form — the use of the connective as the turn’s first term -, two other levels of format analysis are relevant. First the level of establishing a relation with the context (the way the tying with an earlier line of talk is accomplished). Second, the level of unit positioning within current turn (the resumption occurs in turn-initial position and it is preliminary to a next turn-constructional unit in which the resumed line of talk is continued). We compare the construction format with a similar construction type that is used as a vehicle for proposing topic closing in Section 5. In the concluding section (Section 6), we summarize our analysis and discuss its consequences for the semantics of conjunctions. Instead of a monosemic or polysemic analysis from a perspective that takes its starting point in the language system, we advocate an approach in which utterance types are characterized in terms of sequential features.
1. Introduction

A conjunction such as *but, and* or *because* can be used as a device for linking units within the same turn, but can also be used for linking turns. We use the term *sequential conjunction* to refer to the use of connectives — conjunctions, conjunctive adverbs and other types of lexicalized expressions — for specifying relations between turns.¹ A sequential conjunction gives an indication of current turn’s relationship to the preceding talk. For the time being, we want to differentiate this type of use from the one in which it is employed to link clauses or phrases within the same turn (e.g., when a speaker is relating the current turn-constructional unit to the preceding one). Connecting turn-constructional units within the same turn might be different from the work a speaker does when indicating a relationship between the current turn and its interactional context.²

Several types of use of the Dutch connective *maar* (‘but’) as a sequential conjunction can be discerned. A prominent type of use we will not deal with in this paper is its use in objections, as in line 66 of the following fragment³ (the Dutch original is followed by an English translation):

(1) Girls’ argument. *Ans and Bea are teenager girl friends in high school. Ans has accused Bea’s boyfriend of the theft of her motor bike.*

58 Bea:  hij kon e f’re niet expres gedaan
59  0.4
60 Ans?:  mhhHEHh=
61 Ans:  =>WAAROM zegt ie dat dan <van dat mei:sje die bo:ldeh=
62 Bea?:  =Hh
63  0.3
64 Bea:  >OMDAT 1E GEWOON DOOR EEN MEI: SJE IS GEBEL:D
65  0.3
66 Ans:=&gt;maar dat kan ie toch ook verzinnen heb ik
67  0.3
68 Bea:  waarom zou die dat verz[inneh
69 Ans:  [dat weet ik niet

---

58 Bea:  he didn’t do it on purpose
59  0.4
60 Ans?:  mhhhu hh=
61 Ans:  =then why did he say this about this girl who called him=
62 Bea?:  =Hh
63  0.3
64 Bea:  because he was called by a girl of course.
65  0.3
66 Ans:=&gt; but he could have made that up, right?
67  0.3
68 Bea:  why would he make up a thing like [that
69 Ans:  [how should I know?
In line 66, Ans objects to the claim her friend made in the preceding turn. The objection-making relationship with prior turn is marked from the start byprefacing the turn with *maar* ('but').

The type of use of *maar* we will examine in this paper does not have this objection-making quality, at least not at the level of substantive stance-taking. An example of the type of use we will concentrate on is given in the following fragment. It is from a conversation of the same group of high school pupils as fragment (1). In the arrowed turn (lines 332–33), the story-teller Jan resumes the telling of a story that was suspended after a repair initiation of his recipient (lines 317–331). The turn in which the return is made begins with *maar*.

(2) The boy-from-my-former-school story. *From the same group of high school pupils as fragment (1). Two boys and two girls are doing homework, sitting around the same table. During work, they talk about other things.*

```

342 Ans:  there was this guy and he (uh-) I didn't like
343 344 him very much. (0.3)and this was really hilarious
345 [(because uh)
346 Ans:  [("what was his name")
```
In the turn that begins in line 332, maar is used as a resumption marker. It prefaces an initial turn-constructional unit in which the speaker returns to his story. Inbetween, the story’s delivery is stopped because of the repair initiated by its recipient (lines 317–331).

Contrary to the type of use documented in fragment (1), maar is not prefacing a disagreeing utterance here. Note that it does not tolerate (pre-dis-)agreement tokens like yes or no in front of it. Substantial disagreement is not what is at stake here. Rather, the connective signals some kind of contrast at the level of the organization of the discourse. The current turn is not seamlessly continuing the activity the participants were involved in in last turn, but is resuming an activity that was abandoned in the talk that led up to it. It is this resuming use of maar we will analyse.

2. Continue versus resume

If a next speaker moves on by returning to material further back than prior turn, he can either present his turn as a continuation of this earlier talk or do the return as a resumption (cf. Jefferson 1972: 319 ff.). The decision to present the next turn as one or the other is not made automatically. Depending on how a speaker packages a next turn, the preceding talk is either dealt with as some-
thing that can be integrated unproblematically into the ongoing activity (continuation) or as something which is moved away from when the abandoned line is picked up again (resumption).

Compare, for example, the different ways in which the story-teller in the fragment below goes on after an inserted repair sequence. In lines 29–30, the speaker continues the telling of his story with en (‘and’). In lines 53–54, however, the telling is resumed by recycling a story component in a turn beginning with maar. We will gloss the moves that are of interest in the right margin of the corresponding lines in the translation:

(3) Hiking story. From a phone call between friends

The talk after the repair sequence in lines 25–28 is marked in several ways as a continuation. Bob’s weather report in lines 29–30 no longer deals with the trouble source that was remedied in the repair sequence, but is designed so as to be heard as a next component of the telling that was suspended by the repair initiation. The unit that delivers the weather report begins with en (‘and’, line 29). Used as a sequential conjunction here, the connective links the upcoming talk to the preceding talk and adds to it. The weather report does not add to the directly preceding repair sequence, however, but to the telling of the hiking adventures.

After the inserted sequence in lines 44–52, on the other hand, the teller designs his next turn as a resumption of earlier talk. The teller is not returning to the telling by simply delivering the next component of the story. Instead, he
recycles the story component that occasioned the intervening talk. The event that was already talked about in line 41 (then we started to walk) is first reinstated into the talk and then used as a set-up for going on with the telling (lines 53–56: but then uh (.) well then we just walked into the woods (.) we didn't have a flashlight with us ...).

Continuations provide their own “interactional uninterestingness” (Jefferson 1972: 319). Going on is dealt with as an unproblematic thing to do next. Resumptions, on the other hand, indicate that there is “a problem in accomplishing a ‘return’” (1972: 319). In the case of the resumption, the picking up of the telling line is not only framed as a kind of contrast with the foregoing (but ...), but is observably done as a re-instalment of the position from which the abandoned telling can be ‘continued’.

Fragment (3) illustrates each of the different ways to go on with talk that is suspended. The inserted sequence in lines 25–27 is treated as an incidental supplement that is necessary to understand the ongoing story. As a subsidiary sequence, it is integrated into the ongoing talk as something that no longer causes a problem. It is something that can be forgotten because it is “deleted” (Jefferson 1972: 319) in and through continuing the telling of the story.

The talk occasioned by the recipient’s understanding check in lines 44–52 is not dealt with as something that can be integrated smoothly and seamlessly into the ongoing talk. Rather, it is dealt with as a digression from which it is necessary to return in order to be able to go on with the telling. It is oriented to as talk in its own right. It is terminated orderly and collaboratively (see, for example, the co-operative manner in which the story-teller responds to the accounting in lines 49–50). It is treated as a different line of development that requires active re-instalment of the abandoned telling.

Resumptions accomplish non-obvious returns to a line of interaction that was abandoned because something else came inbetween. By using maar as the turn’s first term, the speaker signals the non-incidental, not-unproblematic character of this type of return.

3. Environments of use

The instances of resuming maar we came across in our corpus had in common that they all occurred after a kind of digression from the line that was returned to in the resumption. Without claiming to be exhaustive, we shall discuss two types of such environments: (i) after expansion of a repair sequence that is
inserted in the course of an ongoing telling, and (ii) after a competing line of topic development.

3.1 Environment of use (i): after an expanded repair sequence

One type of context of resuming maar-turns resembles the first two parts of the triplet structure Jefferson uses to characterise side sequences (1972: 316). An on-going sequence (O) is abandoned for a side sequence (S), after which a return (R) to the on-going sequence is made. Schematically:

(4) Jefferson’s side sequence: O - S - R

In fragment (2), for example, the Ongoing Sequence part is the telling in lines 313–16 (the relevant part of the fragment is repeated below). A participant projects a ‘hilarious’ story about this boy from his former school. The story’s delivery is halted when the recipient inquires after the name of the boy (line 317). This inquiry opens the Side sequence part, which runs until line 331. The teller returns to the story in line 332–33 (Return):

(2’) Repeat of the English translation of fragment 2: The-boy-from-my-former-school

313 Jan: listen, (.) >at my former school, you know
314 (0.4) there was this guy and he (uh-)
315 I didn’t like him very much. (0.3) and this
316 was really hilarious (because uh)
317 Ans: ="what was his name."
318 0.5
319 Jan: what=*
320 Ans: ="and what was his name
321 (.)
322 Jan: Alexander,
323 1.3
324 Ans: * which school did you go to then.
325 Jan: =to Saint Martin’s. ((name of the school))
326 (.)
327 Ans: ok:.
328 0.3
329 Ans: (Lower Quay, ) ((name of the area))
330 0.2
331 Ans: rig[ht. ("go ahead")] return
332 Jan: [but thi[s u: : : : i: h (.) this u:h (0.6)
333 this ("boy") (0.3) I didn’t like him very much.
334 it really was a very strange guy,

The environments in which maar-resumptions are done have more in com-
mon than merely being side sequences, however. The side sequences are launched by a repair initiation of the recipient (Schegloff et al. 1977). In fragment 2, for example, this is the question in line 317. Second, the repair initiation begins a repair sequence that is not closed as soon as repair is provided. Instead, the sequence is extended by non-minimal postexpansion(s), as in lines 323–31 of (2).

Because the notion post-expansion (cf. Schegloff 1990 and 1997c) is central to the argument, we will briefly elaborate on it. The extended repair sequence in lines 317–331 of fragment (2) has developed from a base sequence with an adjacency pair structure through different types of sequence expansion. The first pair part of the base sequence is the question that initiates the repair (what was his name?, line 317), and the answer that is given to it is its second pair part (Alexander, line 322). Sequences with adjacency-pair structuring may be expanded before the first pair part (pre-expansion), between the first and the second pair part (insert-expansion; e.g., the inserted repair sequence in lines 319–20), and after the second pair part (post-expansion, as in lines 323–31). The post-expansion in the repair-sequence in fragment (2) is non-minimal. Instead of minimally registering the repair’s successfulness, the repair-initiator reacts with yet another question (line 324). This leads to an expansion of the sequence with at least two more positions (the question turn in line 324, and the answer to it in 325).

Problems in achieving a preferred type of second pair part are a major source for sequence expansion. But even if no direct problem is manifestly observable, sequences may be extended beyond minimal postexpansion. In fragment (3), for example, the recipient of the repair does more than just register its informativeness with the news mark oh. The recipient continues and dwells upon the issue that was re-focused in his understanding check (in the dark? line 44). He gives a reason for initiating repair (lines 47–48), which promotes further explicatory work on the matter from the storyteller (lines 49–50):

(3') Repeat of the English translation of a detail from fragment 3: Hiking story

41 Bob: it was already dark then (.J) then we started to walk (.J)
42 and uh:. (.J) we did about four
43 or five kilometers or something:=
44 Eric:– in the dark?=
45 Bob: =yes repair initiation
46 (.J) repair outcome
47 Eric:– oh (.J) we supposed (.J) that (.J) that you guys expansion
48 were finished (.J) as soon as it were dark (.J) was=
So both in (2) and in (3), we see an inserted repair sequence that has non-minimal postexpansion. Schematically:

(5)  

TELLER:  Ongoing telling  
          Side sequence:  RECIPIENT:  Repair-initiation  
TELLER:  Repair  
          + non-minimal postexpansion  
TELLER:  Return to the telling through Resumption

Non-minimal postexpansion of an inserted repair sequence is not obligatorily oriented to as a context for returning through resumption. See, for example, the repair sequence in the beginning of fragment (3). It has a repair initiation as its first pair part (the what, line 25), and a possible repair as its second (Lac du la Gileppe, line 26). Although the second pair part position itself is expanded with an explication — perhaps due to a lack of recipient uptake —, the return to the ongoing sequence is still done as a continuation, not as a resumption:

(3")  Repeat of the English translation of a detail from fragment 3: Hiking story

So not every type of repair-sequence postexpansion provides an environment for doing a return through resumption. There are specifiable features of repair-initiation types, however, that seem to promote the type of postexpansion after which returns are done as resumptions. Note first that questions like what was his name? (fragment 2) or in the dark? (fragment 3) actively pursue topical interests of the recipient. They bring about a focus shift. In this respect, they differ from the halting, time-marking type of repair initiation such as the ‘the what?’ question in line 25 of fragment (3). This latter class of repair initiation does not promote a recipient-controlled line of topic development. The recipi-
ent primarily acts as the listener who tries to keep track of what is being said in prior turn. The repair initiations that promote side-sequence expansion, on the other hand, propose a recipient-governed shift of focus. If there had been no inquiry after this particular aspect, it would not have been topicalised at this very moment in the interaction.

The slightly different line started by this kind of topically-steering repair initiation becomes even more pronounced when it is followed by yet another sequence elaborating upon it. Instead of minimising discontinuity, the intervening talk is extended with a trajectory of at least two more turns. The side sequence begins to lose its primarily subsidiary character and its topic may become consolidated as talk in its own right. If the talk in a side sequence is clearly subsidiary, the participants work towards a point of return to the main line. As soon as the problem that occasioned the insertion is solved, returning is the appropriate thing to do. A potentially competing line of talk, on the contrary, may be elaborated upon until it is exhausted for other reasons. It supplies its own measurement system for closure readiness.

Participants show their orientation to the side sequence’s greater potential for independence when they do work that is specialised for terminating it. In fragment (2), for example, extensive closing work is done before there is a return to the suspended telling (lines 327–31). The side sequence is not dealt with as a sequence from which an unproblematic return can be made by simply continuing the suspended line of talk. Resumptions attend to this digression potential. They retroactively formulate the elaboration of the repair sequence as a possible departure from the line of talk that the resumption is picking up again.

To summarise: one type of environment in which maar-prefaced resumptions occur is (i) after a side sequence that suspends an ongoing sequence; (ii) the side sequence is launched by a repair initiation of the recipient; (iii) the repair initiation is of a type that has topic-shifting potential; (iv) after the delivery of the repair, there is non-minimal postexpansion of the repair sequence, (v) which is oriented to as a possible departure by doing the return as a resumption.

3.2 Environment of use (ii): after a competing line of development

Maar-prefaced resumptions are also used as a device to return from a recipient-proposed focus shift that is alternative to the line pursued by teller. The pattern of this type of use is characterised in (6):
Apart from describing sequential progress primarily in terms of topical development, the main difference from the pattern for returning from an expanded repair sequence is the second step in the diagram. In the side-sequence instances, the talk intervening between the abandoned telling and its resumption is subsidiary to the delivery of that telling. It is a side line that takes off with a problem that has to be solved in order to be able to pursue the main line. In the type of case outlined in (6), however, there is not a return from a sequence that was subsidiary to an ongoing sequence. Rather, a competitive line of topic development is returned from.

See the fragment below. The steps that were outlined in (6) will be marked again in the right margin of the transcription. The fragment is taken from a phone call between a skipper-family mother — calling from the family’s barge — and her 16-year-old son, who is in a boarding school for skipper children. The Teller’s line starts in line 107, where the mother tells her son that an acquaintance who is a skipper — Uncle Pascal — is coming to the harbor where the family’s barge is anchored. At first, the son does not really promote this line of development, but then accommodates to it when he asks whether another skipper is coming too (line 115). The part with the Competing line begins here. The son’s question causes the mother to tell the latest bits of news about the movements of this other skipper (lines 119–131). As soon as she has told all the relevant details she can about the other uncle, she returns to telling more news about the uncle she herself had volunteered to talk about (line 133). This is the Return-to-teller’s line part:

(7) What-about-Uncle-Karel? From a phone call between mother and son. The mother is calling from the family’s barge. During weekdays, the son is in a boarding school for children from bargee people. He left the family’s home the evening before, on Sunday night.
Dutch 'but' as a sequential conjunction

111 Ma: jah. want d'r e: [h
112 Son: [daar lag niks in de vluchthaven
113 (t'enminste) toen ik 'r met de trein langs ging. =
114 Ma: =n: e: [h

138 Ma: [want dat is 'n eh schip(er eh) >in IJsselstein
139 eh ((clears)) in IJsselstein heeft dat aange[nomen.
140 dus eh: hh die zal vannacht hier op 'ok wel zijn[↓]:
141 0.3
142 Son: uhuh.
--------
103 Ma: there are no ships at all over here, you know!
104 (.)
105 Son: noh,
106 0.2
107 Ma: → no. Uncle Pascal is on his way here, too:
108 0.2
109 Son: oh.
110 (.)
111 Ma: yes. because there u: [h
112 Son: [there was nothing in the refuge
113 harbor (at least) not when I passed there on the train. =
114 Ma: =no: [h
115 Son: → [so what about Uncle Karel
116 0.7
117 Ma: Uncle Karel (Stijn [↑:]
118 Son: =yes the one behind (Gebien:)=
119 Ma: =yes. he has to unload here.
120 (.)
121 Ma: [and in Utrecht.
122 Son: =ahah.
What is happening here is a kind of technical *topic competition* (cf. Sacks 1992b: 348 ff.). The scrimmages already start at the moment the mother tells the news about ‘Uncle Pascal’. The son does not really embrace this topic (see lines 112–13). Yet — on second thought, so to speak — he goes along with the route his mother took, but not without heading for a slightly different course, however. He inquires after another member from the class of persons his mother was talking about (so what about Uncle Karel?). Making a shift to a co-class member — from ‘uncle Pascal’ to ‘uncle Karel’ — is a very elegant way of proposing an alternative focus while still doing topical talk (cf. Sacks 1992a: 756 ff.).

The mother at first fully complies with the line her son is pursuing. At great length she tells the latest news about Uncle Karel (lines 119–131). Yet when her report reaches a possible saturation point — coming back to something that was already talked about before (*since there are no ships at all here / there are so few ships here*, line 103 and line 131 respectively) —, she again picks up the topic of Uncle Pascal. She recycles the announcement of his coming and then continues with an explication of the ins and outs of why this is so.

Returning to *Uncle Pascal* by way of a *maar-prefaced* resumption retroactively formulates the shift to *Uncle Karel* as a competing line of topic development. The talk about *Uncle Karel* was not just a topical alternative, but a line of development that pushed aside the line the mother was pursuing when she launched an elaboration of the *Uncle Pascal* news.
Thus, maar-prefaced resumptions are also used to mark the return from a competitive line of topic development. Although a competing topic is not subsidiary to the talk it is following, there are similarities with the pattern described for returns from expanded repair sequences. First, when the mother launches into an elaboration of the Uncle Pascal news (see her because there *u:h*, line 111), something which is about to become ‘ongoing’ comes to a halt. Although this onset is interrupted without treating its abandonment as suspending an ongoing sequence, it is later on repeated as a re-instatement of a line of talk that could not get through the first time. After the mother has recycled the news of Uncle Pascal’s coming, she continues with a next turn-constructional unit that has the same beginning as the one that was abandoned earlier on (see lines 133–34: *but Uncle Pascal is coming this way too. because* ...). This might be a way of showing ‘this-was-what-I-was-about-to-say-the-first-time’.

Second, as in the side-sequence cases, the ‘owner’ of the abandoned line fully complies with pursuing the line of topic development that is proposed by the recipient. Again, the focus shift is proffered in a way that makes it hard not to comply with. It is formatted as a question. Note, however, that the mother is still the one who does the telling, albeit with respect to a referent that is supplied by her son.

Third, the line pursued by the son is oriented to as talk in its own right that is to be terminated before the abandoned line can be returned to. Only after the recipient has acknowledged the relevancy of the news about Uncle Karel (line 132) does the mother return to her own line of telling.

So both types of environment discussed in this section correspond with respect to the following features: an ongoing activity is abandoned for another one (subsidiary and/or alternative), which is oriented to as an activity in its own right. This line first has to be terminated. The ensuing return to the abandoned line is done as a resumption, not as a continuation.

4. Tying modes: skip-connecting and resuming

The *default* device to tie one turn to another one is simply placing it after the one it is referring to. Jefferson (1978) calls this *next-positioning*. Unless there are indications that point to the opposite, a recipient will assume that current turn is to be interpreted against the background of prior turn. A speaker has to use special devices for tying a current turn to some other-than-last turn.
Some of these devices are discussed in Harvey Sacks' *Lectures on Conversation* (Sacks 1992a/b). Particularly the tying mode he calls *skip-connecting* has several features in common with how resumptions tie to earlier talk. In this section we will compare skip-connecting with resuming as a way to discover the relevant similarities and differences.

Sacks characterises *skip-connecting* as follows: "... a speaker produces an utterance that is indeed related to some prior utterance, but it’s not related to the directly prior utterance, but some utterance prior to the directly prior utterance" (Sacks 1992b: 349). Although this description allows for the inclusion of a whole range of ways of tying a current turn to a pre-prior one, Sacks seems to reserve the notion for a particular type of tying. He discusses a fragment from a multiparty discussion in which there is competition between two participants with respect to the line of development that gets taken:

(8) Example from Sacks 1992b: 348

Roger: ((About the new Pike)) Oh this place is disgusting. 
[ Any day of the week. 
Jim: I think that Pop is [depressing, it’s just-
Roger: [But you go- you go- take-
Jim: Those guys are losing money. hehh
Roger: But you go down- dow- down to th’New Pike there’s a buncha 
[ people, oh:: an’ they’re old, an they’re pretending
((Jim)) (((cough)))
Roger: they’re having fun, but they’re really not.

Roger’s remarks are about the amusement park called the Pike, and Jim’s are about Pacific Ocean Park, another amusement park that gets called ‘Pop’. In each next turn, current speaker relates his utterance to his last one, not to the prior one of the other speaker. Sacks (1992b: 348) diagrams this as:

Roger: Pike
Jim: Pop
Roger: Pike
Jim: Pop
Roger: Pike

Sacks notices two sorts of facts about skip-connecting utterances: speakers tend to skip-connect to one of their own utterances; and they do not skip-connect unless their own utterance was last-but-one (1992b: 349). We diagram this one more time in (9):
Dutch 'but' as a sequential conjunction

(9) **(mutual) skip-connecting:**

\[
\text{speaker B skip-connects from turn}_i \text{ to turn}_j \\
\downarrow
\text{speaker A: turn}_i / \text{speaker B: turn}_j / \text{speaker A: turn}_k / \text{speaker B: turn}_l
\]

Sacks’ first observation — speakers tend to skip-connect to their own utterances — also holds for resumptions: speakers tend to resume their own tellings. In fragment (2) it is the teller of the story about the boy who resumes the telling; and in (7), it is the mother who returns to telling about Uncle Pascal. However, resumption of an abandoned line of talk may be done by its recipient, at least under the kind of conditions we will describe for the fragment below. It is taken from an interaction in a tattoo shop. The fragment begins just after the tattooist has made a remark about the name of a Dutch rock musician on his customer’s T-shirt (*Herman Brood*, in some Dutch music scenes a real legend). The customer then starts talking about a performance he once attended (lines 43–53):

(10) **Tattoo-shop. The tattooist is preparing his customer’s skin for a tattoo. From time to time, he and his customer also engage in talk about things other than the tattoo. Further persons present are Rose (the customer’s girlfriend), and John (a friend of the tattooist).**
Tattooist: *nouh!* (0.3) [(plof ma-)] plof maar effe ne:ver hh:

Customer: [Oke:] 

John: *Twoe:oeh* [(imitates sound of tattoo needle)]

Customer: *Ok~

John: 3.6

Tattooist: turn it *off* againain, [(singing)]

Customer: *ja:h joh.* (0.5) daar was toen ’n de een of andere 

feest eh wees:k. met eh ·hh jah normal die trad 

op. en eh de sie:n. herman brood.

Customer: *there was at some point u::h he was 
somewhere u:hm (1.6) where was it (0.4)

[& m m e h ]

Rose: [(I wasn’t there) re. God!]

Customer: Emmer Compascum~ ((name of a little town))

Tattooist: *jhuh!*

Customer: *oh*

Customer: *yeah, there was uh- (.) a huge party

Rose: [( ) not too high? oh 

((about the position of the tattoo))

sorry. you mind if I meddle?

Tattooist: no not at all.

(....) ((1.5 minutes about other things))

Customer: (should)n’t start working out now. leave it alone.*

Rose: *·h heh h uuh

John: [not uh become a Schwartzenegger,

Rose: *I wouldn’t want him to.*

Tattooist: *right!* (0.3) [(just si-)] just sit down hh:

Customer: [okay ]

3.6

-John: *wo:goeh* [(imitates sound of tattoo needle)]

Tattooist: turn it off againain, [(singing, an English song line)]

Customer: *but- (.) was. (m-) he was in Emmer Compascum

Customer: yes man. (0.5) there was some 

festival uh week. with uh ·hh well Normal* played.

and uh the Scene*. Herman Brood*. ((* Dutch pop groups))
In line 148, the tattooist recycles the first part of the telling his customer had begun about 1.5 minutes before: *but ... he was in Emmer Compascum* repeats the customer’s *at some point he was somewhere ... Emmer Compascum* in lines 43–48. The delivery of this telling was interrupted by a remark from the customer’s girlfriend about the position of the tattoo (line 54). After this, the tattooist goes on with his work, but now and then, they also engage in talk about other things, as in lines 134–38, where the customer talks with the participants in the ‘audience’ about the consequences of a fresh tattoo and working out.

Note that the tattooist recycles a telling part that is immediately recognised and directly taken up by the participant who told it the first time. The mentioning of the fact that he — the singer — was in Emmer Compascum suffices to prompt the former teller to continue to tell about the musician’s performance. In his response, he recycles the sole other orientational description he has already given (*there was uh ... a huge party*, line 53), but in such a way that new information is also supplied (*there was some festival uh week*, lines 150–51).

The tattooist’s role as prompter of the return may be a way of ‘doing-being-a-party’ within the setting of the tattoo-shop. He and his customer have their own participation framework. It can be intruded on from outside (as in line 54), it can dissolve into a plenary participation configuration (as in lines 134–38), but it can also be re-installed by resuming talk that was done primarily as something between the two of them.

Sacks’ second observation about skip-connecting utterances — speakers tend to skip-connect to an utterance of theirs that was last-but-one — does not hold for resumptions. Resumptions usually go back to the *sequence* that came before another — subsidiary, alternative, and/or competitive — sequence came inbetween. Unlike the ‘turn-over-turn’ type of skip-connecting Sacks discusses, resumptions do tie over long distance, albeit still under some kind of a ‘last-before-intervening-line-of-talk’ constraint. Schematically:

(11) **Resumption:**

\[ \text{participant A: line}_i / \text{B and A: line}_i / \text{speaker A: return to line}_i \]

\[ \text{return to the abandoned line of talk} \]

Resumptions do long distance tying. But they do not skip-connect. They re-install a move from the abandoned activity. This explains why the practices by which they are done are so different from the techniques that are used to skip-
connect. The skip-connecting in the fragment from Sacks is done by way of such techniques as full noun repeat (Roger's New Pike), or adding particulars that can only apply to the referent the current speaker was already talking about.

The prevalent way for doing a resumption is a same-speaker recycle of the last telling unit before the speaker's telling was abandoned in favour of a different line of talk. In fragment (7), for instance, this was the news about Uncle Pascal (lines 107 and 133). As a rule, the last telling unit before the telling came to a halt is recycled. Not always, however. In fragment (3), for example, the speaker recycles the utterance about starting to walk again (line 41), and not the very last utterance of the telling before it was suspended (about having walked about four or five kilometres, line 43). Although the telling part that is recycled should be as late as possible in the telling so far, it is only eligible to be recycled if it can serve as a basis for continuation of the telling.

Resumptions typically are done as the first turn-constructional unit in a multi-unit turn. After this initial unit, the speaker continues the abandoned line of talk. When the unit with the recycled telling line is possibly complete, the speaker does not wait for a response that attends to it independently, nor does the recipient treat the recycled unit as an action that should be receipted separately. The resumption is oriented to as 'preliminary' to a specific type of next (cf. Schegloff 1980). It is targeting a next action that uses the recycled telling part as the base to which a next telling part can be attached.

Most of the resumptions we have discussed inherit this property of 'activity-incompleteness' from when they were done the first time (cf. Houtkoop and Mazeland 1985). The utterances that are recycled in (2), (3) and (10) are recognisably not done as independent, stand-alone announcements, but as a part of a larger telling that is not yet complete. Even if the recycled telling does not inherit the property of 'ongoingness' from the source telling, it is oriented to as prefatory, as shown by the telling about Uncle Pascal in fragment (7). The repeating of the 'news' about his coming after a competing line of talk (Uncle Karel's coming) and its framing as being in contrast with this line by prefacing it with maar makes it analysable as preliminary to the delivery of more tellables about the refocused event.

In sum: As a rule, resumptions are done by the speaker of the abandoned line of talk. They do long-distance tying by recycling the last telling component that is suited to serve as a basis for the kind of continuation the speaker is working towards. They are done after possible termination of the intervening line of talk. They not only inherit a property of ongoingness, but as a resump-
tion, they are oriented to as prefatory to some kind of elaboration.

Most recycles are done by repeating material from the source turn. The recycles in (2), (7) and (10) have almost the same wording as when they were said the first time. A repeat is a tying technique that is relatively independent from a turn's actual position. It locates some prior turn as its source by the matching of lexical and constructional materials. What action the repeat is doing, however, is dependent on how it is framed and formatted, where it is used and by whom. Repeats can implement different sorts of actions. When participants repeat a part of the turn of a prior speaker in their next turn, for example, these repeats do such different actions as initiating repair on a trouble source in prior turn, registering the receipt of what prior speaker has said, or targeting 'a next action' — such as rejection or correction — in the next turn-constructional unit (cf. Schegloff 1997a: 527 ff.). The kind of repeat we are dealing with is done by the same speaker and over a long distance. It not only locates an earlier turn-constructional unit by same speaker as its product item (cf. Jefferson 1972). It recycles the action for which it was the vehicle and re-installs it in the context of the activity for which it was abandoned. The abandoned line of talk is retroactively revealed as alternative to and competing with the activity that took its place.

In sum, the position in which the recycle is done (long distance after the possible termination of an intervening sequence), the relation of its speaker to the telling that is re-installed (same speaker), the type of features of the original action that are inherited by the recycle (ongoingness, retroactive formulation as prematurely abandoned), the format of the turn-constructional unit (recycling an integral telling part and framing it as an action that is in contrast with its context), and the continuation without delay with a next turn-constructional unit in which a next telling part is delivered (constituting the recycled telling as preliminary to continuation of the activity it is re-installing), are all features that jointly contribute to the interpretability of the utterance as a resumption.

5. Furthering versus closing the topic

The construction format [turn-initial maar + recycled telling component] thus appears to be used as a practice that implements a specific type of action in specifiable types of environments. Quite similar formats can be used to do very different actions in other types of environments. In the fragment below, a set of
similar features is to be found in an utterance that proposes topic closure. A comparison with the use of this latter type of turn will help to understand what kind of practice it is that speakers use as a vehicle for doing resumption.

The fragment is from the same mother-and-son call as fragment (7). It opens with a topic proffer from the mother (*were you in time for the train yesterday?*, line 212). At the end of the fragment, the mother initiates closure of the talk about this topic by re-addressing the very same issue she started with (*but anyway you were on time, weren’t you*, line 238):

(12) **In-time-for-the-train?** *From the same phone call as fragment 7, but more towards the end of the call.*

212 Ma:→ *were you in time for the train yesterday*
213 0.6
214 Son: *uh: yes. well yes.*
215 Ma: *yes. it wasn’t that far, was it*
The mother proposes topic closure by returning to the question that launched the topic. Returns to the start of the sequence or the topic are among the most common turn types that serve to initiate sequence-closing (see Schegloff 1997c: 189 ff.). The return is packaged as a request for confirmation (... you were on time, weren't you?, line 238). By confirming it, the son aligns with the closure proposal it is implementing (yes, line 239). The ensuing talk — in particular the mother's announcement that she does not have anything left to tell (line 244) — shows the participants' orientation to the current state as next to a possibly closed topic.

The construction format of the turn in which the mother proposes topic closure is very similar to the one used for doing resumptions. The utterance occurs as the first turn-constructional unit, it is prefaced by maar and it is followed by a repeat of earlier materials. The wording of the mother's original question is copied almost literally. However, this time not as a question, but as a request for confirmation (of something the addressee has already committed himself to, by the way). Although there is a return to the issue the initial action was about, the action itself is not recycled, nor is the activity it was part of re-
installed. The properties of an utterance do not have to be inherited when only its content is repeated.

In sum: although at first sight very similar to the construction type of resumptions, both the construction format of maar-prefaced closings and the environment in which they are used do differ with respect to essential sequential features. These account for the fact that this type of turn implements a very different type of action.

6. Discussion

We have analysed the properties of a specific type of use of the Dutch connective maar ('but'). When it prefaces a turn it marks a relation between turns, not between same-turn units. In order to characterise its use in utterances that resume an abandoned line of talk, we first distinguished different procedures deployed to return to a suspended line of talk (continue versus resume). We then described two types of environments in which resuming maar occurs: after repair sequence expansion, and after a competing line of topic development. In Section 4, we showed that, as a rule, resumptions are done by the speaker of the abandoned activity and over a long distance. The resumption is accomplished by recycling the last unit of the abandoned activity that is suited as a base for its continuation in the next turn-constructional unit.

In text-linguistic literature on the use of maar, it is pointed out that maar usually triggers the conversational implicature that the maar-part of an [assertion₁, maar-assertion₂]-utterance is to be considered as the carrier of the utterance's relevant information (Foolen 1993: 117–118 and Spooren 1989). By prefacing a turn with maar, a speaker proposes a similar kind of ranking, but now at the level of sequential and topical organisation (see also Schiffrin 1987: 173–75). Resumptions bring about a relevancy structuring of participant agendas. By maar-prefacing a re-instalment of his own line of talk, the speaker formulates the intervening talk — that is to say, the talk between the resumed and the resuming utterance — as alternative to, competitive with and/or a departure from the line of talk that is picked up again.

In an attempt to maintain a unified description of the meaning of maar that would also account for its discourse-organising uses, Redeker (1994) proposes the following characterisation: 'Maar as a segmentation signal constrains the expectation that the ongoing discourse segment will be continued'¹⁰ (1994: 219). We think that this account is too narrow. It might even turn out to
be inappropriate. In most of the fragments we have discussed, the participants have already been working towards closure of the intervening sequence (see the discussion of fragment 2 and 3 in Section 3). It seems rather unlikely that the participants would foster the expectation that the current discourse-segment will be continued in an environment in which they are already engaged in terminating it.

If there is anything that is contradicted in resuming-maar turns, it is rather the expectation that the re-installed activity has been terminated. Although it was abandoned, it is still on the agenda of the current speaker. Resuming-maar re-structures local discourse-organising relevancies. It lends priority to the resumed activity and formulates the intervening sequence as a competitive side line.

Our criticism of an attempt to provide a unified description of some kind of 'basic meaning' of the conjunction does not imply, however, that we are in favour of a polysemic approach, that is, a modelling of the meaning of the conjunction according to which different types of use are based on different meanings that are interrelated in more or less systematic ways. The polysemy model puts too much weight on the meaning of isolated words as part of the language system. Instead, some types of uses of the conjunction may contribute to repeatedly occurring, constructionally specifiable types of utterances. They can be thought of as practices that accomplish specific types of actions in sequentially specifiable types of environments (cf. Schegloff 1997a: 504 ff.).

The construction format [maar + recycling an abandoned telling] used in an environment of the possible closure of a potentially alternative line of development is one such practice. It may be used as a device for resuming an abandoned line of development that came before the alternative one. The construction format [maar + return to the start of the topic] is another type of example. It may be used to propose topic closure in an environment of topic talk that has reached the stage of topic exhaustion (see Jefferson 1981).

What a word is doing in an utterance must eventually be determined by sequential reasoning: why is this said by this participant in this position in this manner? The action an utterance implements governs how the linguistic elements of the utterance itself are dealt with when they are made sense of. It is not the other way around. The action quality of an utterance is not to be deduced from linguistic form. Linguistic form contributes to the utterance's construction type, but the features that make it a construction type are at least partially and unavoidably derived from its situated use in talk in interaction.
We want to conclude with two methodological remarks. First, an utterance property such as the use of a technique to recycle an earlier utterance appears to be central in determining the features of resuming-\textit{maar} utterances. An utterance can only be recognised as a recycle or as a return, however, when the utterance’s environment is taken into account. Analysing an utterance as recycling a previous one is a function of the \textit{<utterance, context>} pair. It is not an inherent property of the utterance per se. In order to be able to describe at least some kinds of uses of connectives in turns at talk in interaction, it appears to be necessary to include sequential properties into the description of the utterance-type that is examined.

Second, we looked at just one type of use of \textit{maar} as a sequential conjunction. It was essential to describe the sequential properties of the utterance-type in order to be able to determine how it is used. We think this might prove to be a productive approach for research into the use of connectives. Instead of claiming a basic meaning for the connective \textit{per se}, its workings in sequentially specifiable types of utterances have to be examined. The meaning of words may then really turn out to be a function of their use in utterances in turns at talk in specifiable sequential environments.

Notes

* The paper is a thoroughly revised version of Mazeland and Huiskes 1997. It is partially based on Mike Huiskes’ master’s thesis (Huiskes 1996). We are very grateful to Gail Jefferson for commenting on some of the analyses we had doubt about. We presented the paper at the CCCC workshop at the University of Konstanz in October 1998 (\textit{Cause, Condition, Concession and Contrast: Cognitive and discourse perspectives}). We thank the participants of this workshop, particularly Peter Auer, who acted as the discussant for this paper, for their comments and a stimulating discussion. Finally, we thank Claire van den Donk and Marjolijn Verspoor for taking a look at the way we use(d) the English language. And, of course, we thank the editors for their careful readings.

A part of Harrie Mazeland’s research on the subject of this paper was made possible by a three-month stay in autumn 1998 as a guest professor at The International Graduate School in Language and Communication, Odense University, Denmark.

1. The first time we encountered the term \textit{sequential conjunction} was in Jefferson (1981).
2. Heritage and Sorjonen (1994) describe how \textit{and}-prefaced questions do not just link a question to the preceding turn, but to the preceding question/answer-pair(s) as a next step in an agenda-based course of action in interactions in institutional settings. The use of the conjunction is analysed by taking the interactional context into account, “including, most
importantly, the sequential and activity context” (1994: 2) together with the speech act type of the utterance that is prefaced by the connective.

3. The transcription fragments (1) and (2) come from a corpus of high school pupil talk in a homework class, recorded and transcribed by Henrike Padmos. Fragment (3) comes from a small corpus of telephone conversations between friends transcribed by Heidi van Mierlo and Chris Driessen. Fragment (10) is from recordings made in a tattoo-shop, transcribed by Rozemarijn de Kruijf. The fragments (7) and (12) come from a corpus of phone conversations transcribed by Harrie Mazeland, who also did a second transcription round for the other transcriptions.

The base corpus that was used for this analysis consists of two small corpora with recordings of phone calls. In the course of our research, the collection was extended with a corpus of high school pupil conversations and a couple of transcriptions that were made for student assignments.

4. By saying was after his turn has already arrived at a possible completion point, Eric does a transition-space self-repair substituting the plural ‘were’ with the grammatically correct singular ‘was’ (cf. Schegloff 1997b).

5. We have the impression that in this family — or perhaps in this skipper subculture —, some of the acquainted skippers are referred to as ‘Uncle X’ in interactions between parents and their children (where X usually is a surname, that may be followed by the family name if further identificational material is needed, as in line 117).

6. ‘Uncle Karel (Stijn)’: ‘Stijn’ is probably a family name.

7. ‘Gebien’: perhaps a geographical name.

8. Gail Jefferson pointed out that the mother also packages the return to the telling about uncle Pascal as a next when she says that Uncle Pascal is coming this way too (line 133), — as if she is adhering to her son’s topic (Uncle Karel), instead of the other way around.

9. The tattooist’s resumption in fragment (10) exhibits an interesting instance of the use of a personal pronoun as a tying device. In ‘but- ... he was in Emmer Compascum’ (line 148), the locally subsequent reference form ‘he’ is used on an occasion that is not an obvious locally subsequent reference position (cf. Schegloff 1996: 450 ff). This ‘mismatch’ between reference form and reference position, however, contributes to the turn’s interpretability as a resumption. One and a half minutes after the talk about this person is abandoned, the tattooist refers again to the rock musician with a personal pronoun (line 148). Inbetween, several other, possibly competing referents were talked about (see, for example, the mention of Schwarzenegger in line 136). Still, the shop-owner’s utterance supplies sufficient cues to enable the recipient to identify the rock musician as the referent of he. By saying that he was in Emmer Compascum, lexical material is repeated that is unmistakably associated with the customer’s former telling about the rock musician. However, referring via a next-time reference form to a person not talked about for some time shows that the talk about this subject was not closed yet (see Fox 1987: 16–32). The incongruent, and thereby marked use of a locally subsequent reference form in a locally initial reference position contributes to the utterance’s recognisability as a resumption. The use of a marked reference form thus may have discourse-organising effects. (See also Mazeland 1996.)
10. Our translation. The original quote goes as follows: "Maar als segmentatiesignaal legt een restrictie op de verwachting dat het lopende discourse-segment gecontinueerd zal worden" (Redeker 1994: 219).
