

Two Variables

Inf. Stats

We often wish to compare two different variables

Examples: different tests results, age and ability, education (in years) and income, speed and accuracy,...

Methods to compare two (or more) variables:

- correlation coefficient
- regression analysis

Notate bene!

- numeric variables

Background

Inf. Stats

Terminology: we speak of CASES, e.g., Joe, Sam, . . . and VARIABLES, e.g. height (h) and weight (w). Then each variable has a VALUE for each case, h_j is Joe's height, and w_s is Sam's weight.

We compare two variables by comparing their values for a set of cases,

- h_j vs. w_j
- h_s vs. w_s
- etc.

Tabular Presentation

Inf. Stats

Example: Hoppenbrouwers measured pronunciation differences among pairs of dialects. We compare these to the geographic distance between places they're spoken.

| Dialect Pair | Phon.Dist. | Geo.Dist. |
|--------------------|------------|-----------|
| Almelo/Haarlem | 0.58 | 100 |
| Almelo/Kerkrade | 1.18 | 200 |
| Almelo/Makkum | 0.90 | 250 |
| Almelo/Roodeschool | 0.81 | 220 |
| Almelo/Soest | 0.91 | 70 |
| Haarlem/Kerkrade | 1.06 | 230 |
| : | : | : |
| Kerkrade/Soest | 1.14 | 201 |
| Makkum/Roodeschool | 0.95 | 125 |
| Makkum/Soest | 1.00 | 216 |
| Roodeschool/Soest | 0.94 | 163 |

Two variables—phonetic and geographic distance, and 15 cases (here, each pair is a separate CASE).

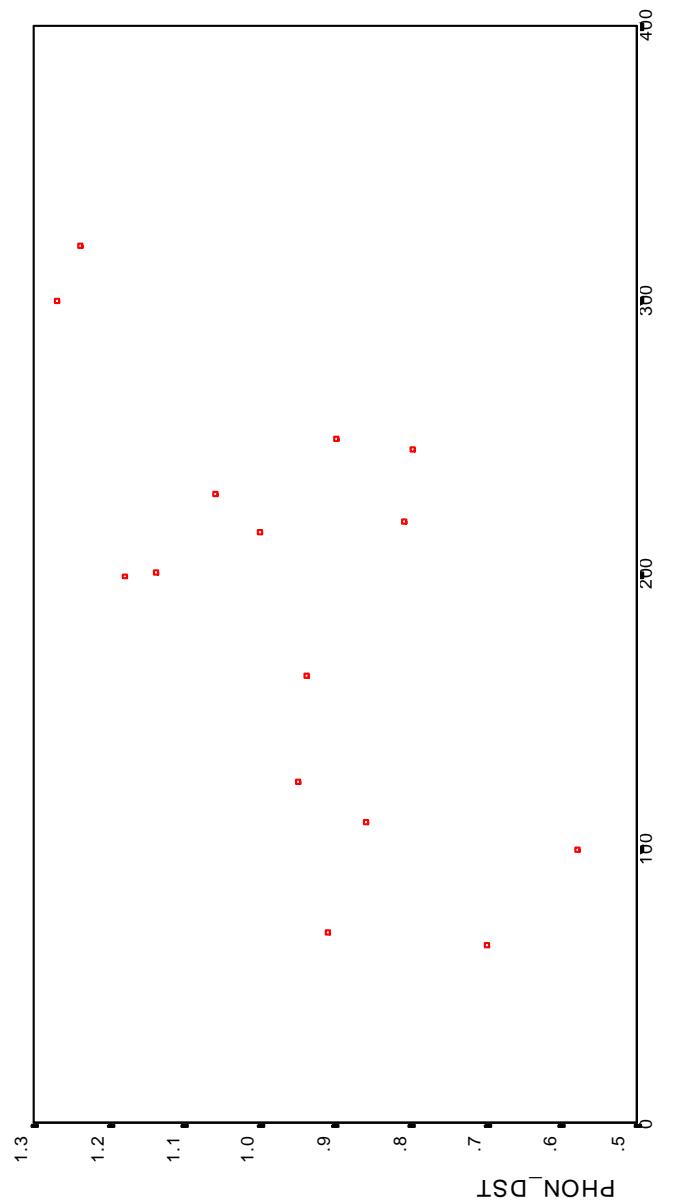

RuG

Scatterplots

Inf. Stats

One useful technique is to visualize the relation by graphing it.

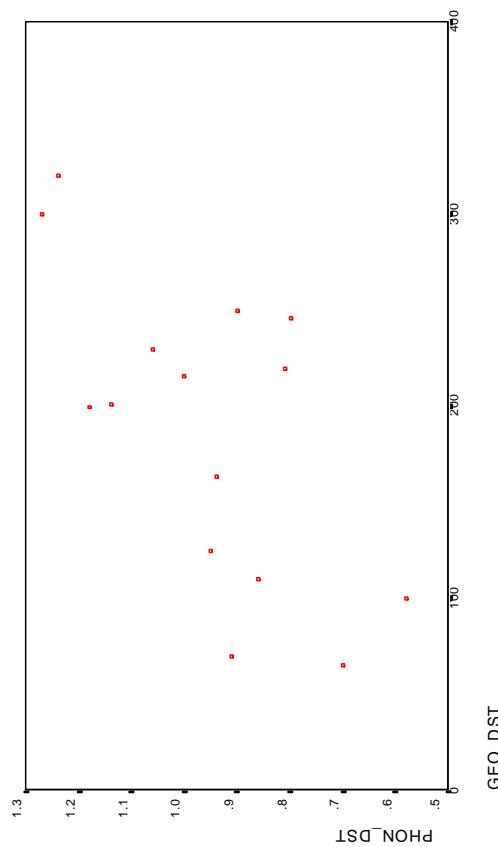

RuG

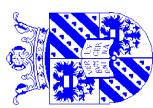

Scatterplots

Inf. Stats

Each dot is a case, whose x -value is geo. distance, and y -value phon. distance.

In general, we use x -axis for INDEPENDENT variables, and y for (potentially) DEPENDENT ones. We don't know whether phon. distance depends on geo. distance, but it might (while reverse is implausible).

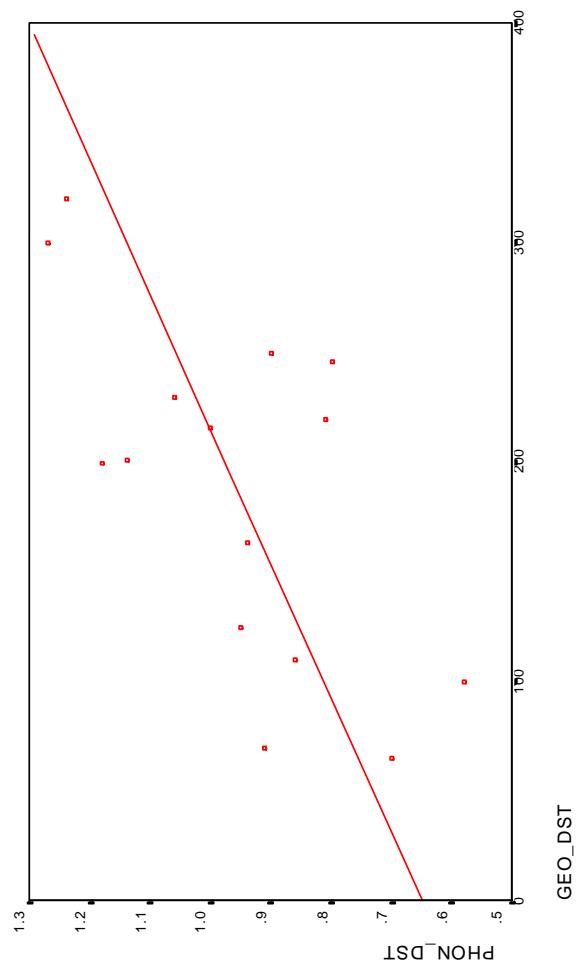

Least Squares Regression

Inf. Stats

The simplest form of dependence is LINEAR—the independent variable determines a portion of the dependent value.

We can visualize this as fitting a straight line to the scatterplot.

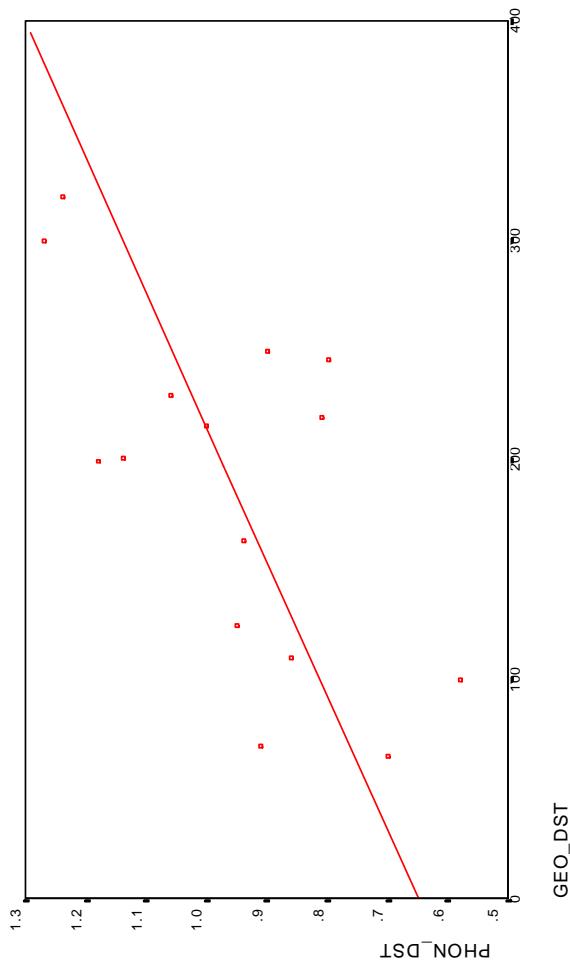

RuG

Least Squares Regression

Inf. Stats

Like every straight line, this has an equation of the form: $y = a + bx$

a is the point where the line crosses the y -axis, the y -INTERCEPT, and b the SLOPE.

RuG

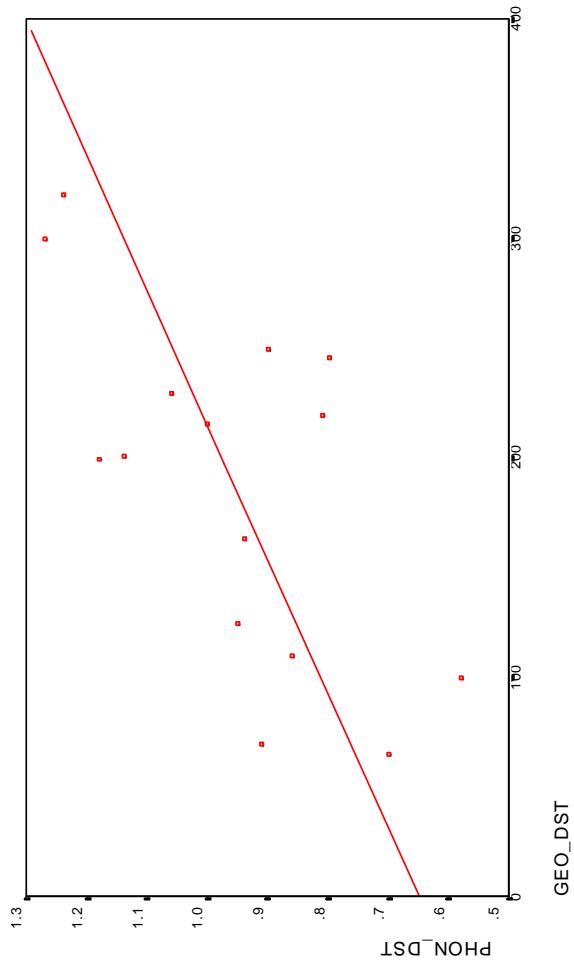

Predicted vs. Observed Values

Inf. Stats

The independent variable determines the dependent value (*somewhat*); this is the predicted value \hat{y} —the value on the line.

Note also the actual y —the data dot, not always the same.

RuG

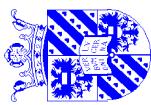

Residuals

Inf. Stats

The difference between predicted and actual values $d_i = (\hat{y}_i - y_i)$ is the RESIDUAL—what the linear model does not predict. It is the vertical distance between the dot and the line.

LEAST-SQUARES REGRESSION finds the line which minimizes the squared residuals—for all the data.

$$\sum_i d_i^2 = \sum_i (\hat{y}_i - y_i)^2$$

SPSS Regression

Least-squares regression finds the best straight line which models the data (minimizes the squared error).

----- Variables in the Equation -----
Variable B SE B

| Variable | B | SE B |
|------------|---------|------------|
| GEO_DST | .001631 | 5.1714E-04 |
| (Constant) | .649778 | .104898 |

$$y = 0.65 + 0.0016x$$

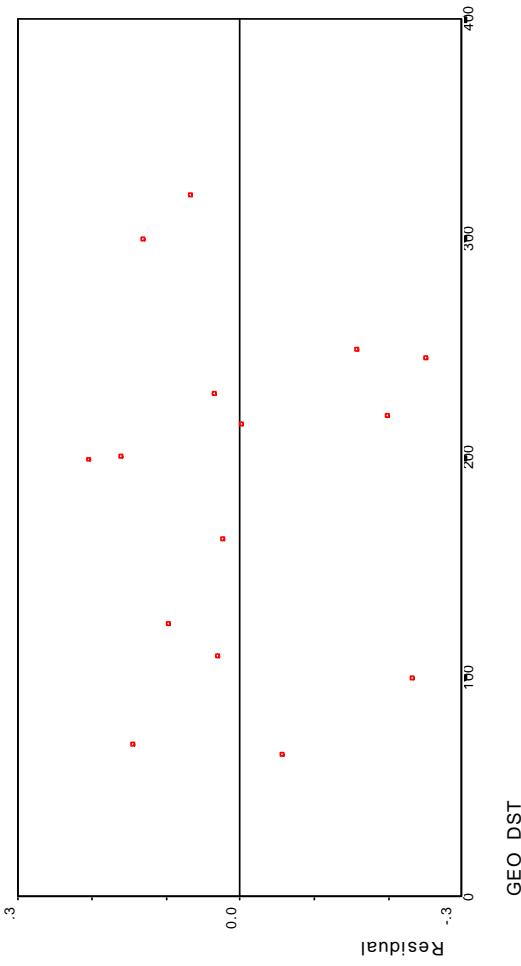

Residuals

Inf. Stats

Regression finds best line, but is sensitive to extreme values. Examine residuals.

Residuals of Least Squares Regression

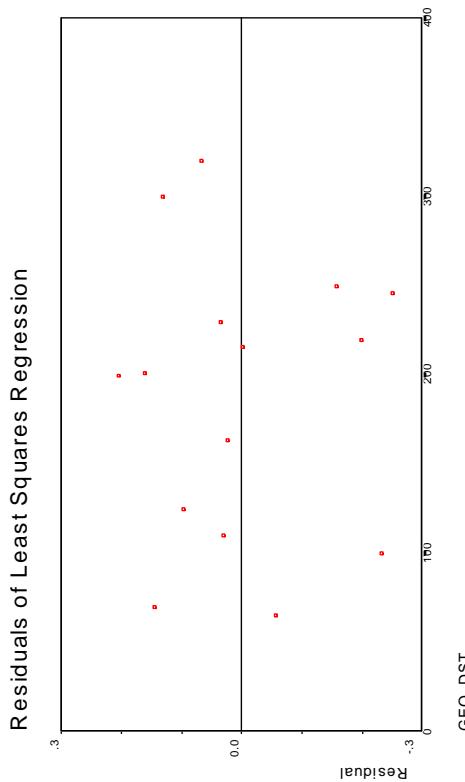

RuG

SPSS Plot of Residuals

Inf. Stats

Save residuals as new variable, then graph vs. original x value.

Watch out for extreme x values—**influential**, though residual may be small. See example 2.12 in Moore and McCabe.

Also examine OUTLIERS—large residuals.

RuG

Least Squares Regression*

Inf. Stats

(optional)

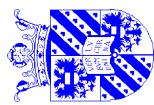

How does regression work?

We express the squared residuals as a function of the line. This is a function in two variables: a , the intercept, and b , the slope.

$$\begin{aligned} f(a, b) &= \sum_i d_i^2 \\ &= \sum_i (\hat{y}_i - y_i)^2 \\ &= \sum_i ((a + bx_i) - y_i)^2 \\ &= \sum_i (a + bx_i - y_i)^2 \\ &= \sum_i a^2 + 2abx_i - 2ay_i + b^2x_i^2 - 2bx_iy_i + y_i^2 \end{aligned}$$

To minimize this function, find where its derivative $f' = 0$.

RuG

Least Squares Regression*

Inf. Stats

$$f(a, b) = \sum_i a^2 + 2abx_i - 2ay_i + b^2{x_i}^2 - 2bx_iy_i + {y_i}^2$$

To minimize a function in two variables, look at partial derivatives in f_a' , f_b'

$$\begin{aligned} f_a'(a, b) &= \sum_i 2a + 2bx_i - 2y_i \\ f_b'(a, b) &= \sum_i 2ax_i + 2bx_i^2 - 2x_iy_i \end{aligned}$$

We then set each partial derivative to zero, and solve (the pair of linear equations).

Regression—Tiny Example*

Inf. Stats

| Dialect Pair | Phon.Dist. | Geo.Dist. |
|----------------------|------------|-----------|
| Almelo/Haarlem | 0.58 | 100 |
| Almelo/Kerkrade | 1.18 | 200 |
| Kerkrade/Roodeschool | 1.27 | 300 |

$$\begin{aligned}f_a'(a, b) &= \sum_i 2a + 2bx_i - 2y_i \\&= 2a + 2b(100) - 2 \times 0.58 + \\&\quad 2a + 2b(200) - 2 \times 1.18 + \\&\quad 2a + 2b(300) - 2 \times 1.27 \\&= 6a + 1200b - 6.06 \\f_b'(a, b) &= \sum_i 2ax_i + 2bx_i^2 - 2x_iy_i \\&= 2a(100) + 2b(100)^2 - 2 \times 100 \times 0.58 \\&\quad 2a(200) + 2b(200)^2 - 2 \times 200 \times 1.18 \\&\quad 2a(300) + 2b(300)^2 - 2 \times 300 \times 1.27 \\&= 1200a + 280,000b - 1350\end{aligned}$$

RuG

Regression—Tiny Example*

Inf. Stats

Now we solve these two linear equations (set to zero).

$$\begin{aligned} 0 &= 6a + 1200b - 6.06 \\ 6a &= 6.06 - 1200b \\ a &= 1.01 - 200b \\ 0 &= 1200(1.01 - 200b) + 280,000b - 1350 \\ &= 1212 - 240,000b + 280,000b - 1350 \\ 40,000b &= 1350 - 1212 \\ b &= 138/40,000 = 0.00345 \\ a &= 1.01 - 1200(0.00345) = 0.32 \end{aligned}$$

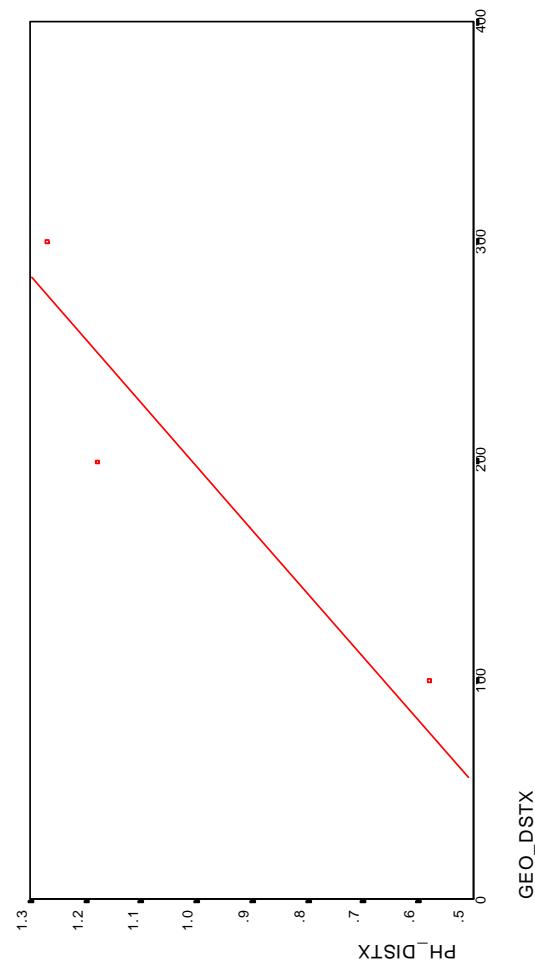

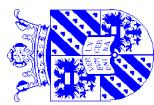

Example, Cont.

Inf. Stats

$$y = 0.32 + 0.00345x$$

Regression with 3 Cases

| (Constant) | .320000 | .318041 |

Linear Regression

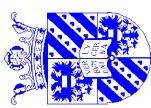

Inf. Stats

- Asymmetric—appropriate when one variable might be “explained” by a second
 - Reaction time on basis of difficulty — negative!
 - Child’s ability on basis of parents’
 - etc.
- No answer (yet) to how well does x explain y

CORRELATION analysis provides answers.

- Symmetric measure of extent to which variables predict each other
 - Answer to how well does x explain y
- Regression, correlation inappropriate when “best line” not straight (need transformations).

RuG

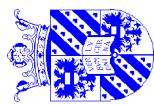

Correlation Coefficient

Inf. Stats

aka “Pearson’s product-moment correlation”

$$r_{x,y} = \frac{1}{n-1} \sum \left(\frac{(x - \bar{x})}{s_x} \right) \left(\frac{(y - \bar{y})}{s_y} \right)$$

- reflects strength of relation
 - 0 no correlation
 - 1 perfect positive correlation
 - 1 perfect negative correlation
- no necessary dependence!
 - shoe size, reading ability correlate—both dependent on age

Correlation Coefficient

Inf. Stats

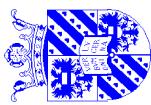

- - Correlation Coefficients - -

| | | |
|---------|-------------------------------------|--|
| GEO_DST | GEO_DST 1.0000 (15) P= . | PHON_DST .6584 (15) P= .008 |
|---------|-------------------------------------|--|

PHON_DST .6584 1.0000

—geographic and phonetic distance correlate at 0.65

RuG

Correlation

Inf. Stats

$$r_{x,y} = \frac{1}{n-1} \sum \left(\frac{x - \bar{x}}{s_x} \right) \left(\frac{y - \bar{y}}{s_y} \right)$$

alternative:

$$r_{x,y} = \frac{1}{n-1} \sum_{i=1}^n z_{x_i} z_{y_i}$$

- r “pure number” — no units
- insensitive to scale, percentages, ...
corr. w. temperature can ignore scale
- symmetric $r_{x,y} = r_{y,x}$

Properties of Correlation

Inf. Stats

$$r_{x,y} = \frac{1}{n-1} \sum_{i=1}^n z_{xi} z_{yi}$$

- r measures “clustering” relative to σ_x, σ_y
as $r \rightarrow 1$ (or -1), dots cluster near regression line
- careful when “eyeing” data
 - change in σ affects apparent clustering
 - separate clusters lose in correlation
 - watch for nonlinear relations

Correlation/Regression

Inf. Stats

regression analysis — r^2 : how much of y 's variance may be attributed to x ?

- nonsymmetric: y analyzed as dependent on x
- smoothed plot of y averages (for x groups)
- always flatter than SD line, the line with slope σ_y/σ_x which passes through (m_x, m_y)
- regression line (Gauss):

$$y = a + bx$$

then

$$b = r \frac{\sigma_y}{\sigma_x}$$

Interpretation of Correlation via Averages.

Inf. Stats

Example: height, weight have corr. coeff. $r = 0.5$

$$\mu_h = 178\text{cm}, \mu_w = 72\text{kg}, \sigma_h = 6\text{cm}, \sigma_w = 6\text{kg}$$

- for each σ_x , there are $r \cdot \sigma_y$'s
- what is ave. weight of those 184 cm tall?

$$\begin{aligned} 184\text{cm} &= 178 + 6\text{cm} \\ &= \mu_h + 1 \cdot \sigma_h \\ \delta_{\sigma_h} &= 1 \end{aligned}$$

$$\begin{aligned} \bar{w}_{184\text{cm}} &= \mu_w + r_{w,h} \cdot \delta_{\sigma_h} \cdot \sigma_w \\ &= 72\text{kg} + 0.5 \cdot 1 \cdot 6\text{kg} \\ &= 75\text{kg} \end{aligned}$$

RuG

Interpretation of Correlation via Averages.

Inf. Stats

- for each σ_x , there are $r \cdot \sigma_y$'s, $0 \leq r \leq 1$.
- $\Rightarrow \delta_w$ less (in z terms) than δ_h

since $r \leq 1$ averages of correlated variables must “regress” toward mean

Regression Fallacy

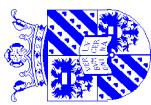

Inf. Stats

Height/weight example: In figuring \bar{w} for restricted groups: δ_w less (in \approx terms) than δ_h

Since $r \leq 1$, averages of corr. var. **must** “regress”—but this is purely mathematical, no causal

“Regression fallacy”: —seeing causation in regression

- height correlation between parents and children ($r = 0.4$)
but very tall parents have less tall children (still taller than ave.)
- test-retest situations show extremes (high and low) closer to mean on second test
- “the course showed no general improvement, but the worst students improved”

Correlation

- measures strength of linear relation
- symmetric $r_{x,y} = r_{y,x}$
- related to slope of regression line

Caution needed:

- outliers — reduce r
- nonlinear association, e.g. intensity vs. loudness
- “ecological correlations” use averages, rates popular in politics, but overstate r (based on individuals)
- correlation $\not\rightarrow$ causation
- example: shoe size and reading ability

Regression Error

$\mu : \sigma ::$ regression line : regression error

regr. error measures dispersion around regr. line

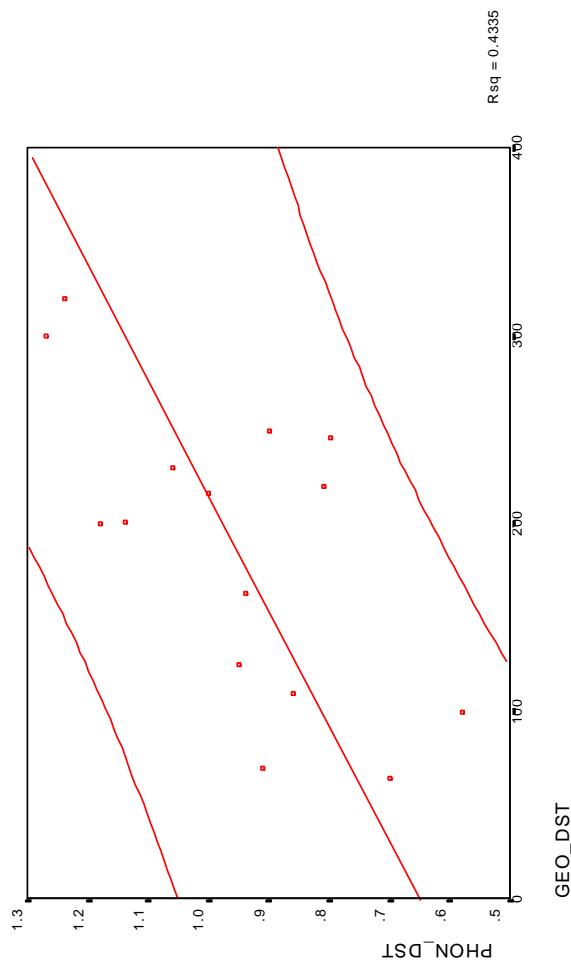

regr. error can be calculate as standard deviation (from regression line, but also
(shorter)) = $\sqrt{1 - r^2} \times \sigma_y$

n.b. reg.error $\leq \sigma_y$

SPSS Plot of Regression Error

Inf. Stats

Shows ± 2 standard errors around regression line—where 95% of data must be found.
