

Transcriptions for: A Corpus of Regional Dutch Speech

Transcriptions are made in XSAMPA (see fig. 1), according to the conventions for Netherlandic Dutch (Gussenhoven, 1992) and Belgian Dutch (Verhoeven, 2005), with the following adaptations and additions:

- Syllable boundaries are transcribed with a dot [.]
- /l/ has two allophones: [l, ʃ]
- There are different allophones for /x/: [C, x, X] ([h] can also be found)
- Nasals and approximants can be syllabic
- Plosives before syllabic nasals are transcribed (even though they are realized through the nasal cavity [pm̥, bm̥, tn̥, dn̥, kN̥, gN̥])
- Different allophones for /r/ are transcribed : [r, ʀ, r̥, R] ([R̥] can also be found)
- Diphthongs are in general transcribed with approximant or schwa, except for [ɔy].
- The transcriptions contain two levels of stress [˘, ˙]
- Other diacritics that are used: [ː, _h, _0, ~]
